

ABSTRACT

A combination barbecue, smoker and fire pit assembly having removable and changeable components to selectively put the assembly in a barbecue mode, a food smoker mode, and a fire pit mode. While in the barbecue mode, the assembly includes a base for defining a heat source and a grid above the heat source for supporting food to be cooked. A lid is secured on top of the body. While in the fire pit mode, the assembly includes a non-enclosed housing between the lid and the base which defines the heating area. The heat source is moved to the top of the base. While in the smoker mode, an enclosed housing defining the smoker area replaces the non-enclosed housing. In this mode, the grid for supporting food is moved to the top of the enclosed smoker housing and the heat source support is at the bottom of the base. At least one additional support for supporting smoke-generating components is secured between the grid and heat source support.
